NOTE: This is a 'working draft' sequence. It currently consists of 30 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be 223368

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is the nucleotide sequence of the Human MUC18 cell adhesion CC glycoprotein, which is expressed on the surface of melanoma cells, CC and can be used as a marker for prostate cancer.

CC This MUC18 (humWC18) cDNA sequence is different from the humWC18 cDNA CC given in Genebank accession number N28882, Z20931. The deduced amino acid C residues from this cDNA are very different from that published by CC Johnson's group in 1989.

CC The presence of this glycoprotein has been correlated with normal vascular CC tissue, and on the smooth muscle of venules, and it expresses

CC Sporadically on capillary epithelium.

CC The method can be used as a diagnostic test for prostate cancer which has a relatively high potential for metastasis or which has metastasized.

CC This allows the physician to choose appropriate surgical, radiation, cor chemotherapeutic treatment regimens. In addition, antibody specific CC MUC18 can be used to prevent metastasis of prostate Cancer Cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Ma

                                                                                                                                                                                                                       This is the modified nucleotide sequence of MUC18 with primer binding sites (Z20935 and Z20936) to introduce a BamHI site just upstream of the translation start site in order to facilitate cloning. The presence of this glycoprotein has been correlated with the ability of melanomas to metastasize. MUC18 is also associated with normal vascular tissue, and on the smooth muscle of venules, and it expresses sporadically on capillary epithelium. The method can be used as a diagnostic test for prostate cancer which has a relatively high potential for metastasis or which has metastasized. This allows the physician to choose appropriate surgical, chemotherapeutic or radiation treatment regimens. In addition, antibody specific to MUC18 can be used to prevent metastasis of Prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ното

These sequences were used in the design of EP muteins which contain a modification, pref. a replacement of an amino acid. The EP muteins may be used to stimulate the production of erythrocytes and induce proliferation of cell cultures responsive to EP. These muteins can be used effectively at lower dosage than wild-type EP. This may reduce their potential adverse effects associated with administration of EP, such as exacerbation of hyper-

The present invention describes recombinant human EPO which causes bone marrow cells to increase production of reticulocytes or red blood cells, where the polypeptide is the product of expression in CHO (Chinese hamster ovary) cells of an exogenous DNA sequence encoding human EPO. EPO is potentially useful in the diagnosis and treatment of blood disorders characterised by low or defective red blood cell production.

the polyA site of the bovine growth hormone gene. Haematocrit levels increased in SCID mice injected with the vector i.m. pcMv-KM-cmEPO is an example of a vector that can be used in novel compositions and methods for improved polynucleotide delivery into cells. In these methods, polycationic agents are used to increase the feature of the composition of the compositions are methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gene
                                                                                                                            or a vaccinating viral or cancer antigen, (antisense or ribozyme). The methods and in the gene therapy of many diseases.
                                                                                                                                                                                          the frequency of uptake of a nucleic acid (see also V21683-86) into a cell. The polycationic agent can condense with the nucleic acid and inhibit serum and/or nuclease degradation of the nucleic acid. The nucleic acid can be a vector, may express a therapeutic protein or a vaccinating viral or cancer antigen, or is itself therapeutic (antisense or ribozyme). The methods and compositions can be used in the case of the case 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the human cytomegalovirus immediate early gene promoter/enhancer the polyA site of the bovine growth hormone gene. Haematocrit levels increased in SCID mice injected with the vector i.m.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polycationic agents based on alpha-amino acids, able to complex with nucleic acid - to facilitate its entry into cell, condense and protect it against serum degradation, particularly for use i

The invention relates to subunits cellulose synthetic equipment, that can be used to increase the amount cellulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being produced by a plant.

P-PSDB;
Numerous alpha IC-specific DNA clones were isolated. Characterisation of the sequence revealed the alpha IC coding sequence, the alpha IC initiation of translation sequence, and alternatively spliced region of alpha IC. Q37814 and Q37815 elements of the alpha IC protein. Q37
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1733
